

Keypad Modules

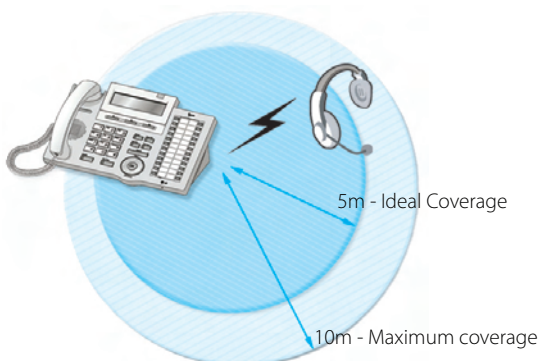

The 7000 Series 24 Button keypad can have optional modules installed to provide additional features such as Bluetooth connectivity and USB call recording.

Bluetooth Module

Bluetooth wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. The Bluetooth module for the 24 Button keypad and 24 Button Large Display enables the keypad with powerful Bluetooth connectivity - up to a 10m range can be covered.

Users can then use any Bluetooth compatible headset with their desk phone to give wire-free conversation. This technology can improve productivity by allowing users to hold telephone conversations whilst keeping both hands free. Often users find that by using a Bluetooth headset they are able to work quicker with less mistakes - especially in situations where the user is required to type or use a computer whilst holding conversations.

USB Module

The USB module for the 24 Button and 24 Button large display keypads allow you to connect the keypad to a USB port on a computer. This connection then allows you to use specialist software, supplied by LG-Nortel, to record and play back your telephone conversations.

The USB module connects to the underside of the keypad, taking up no additional desk space or altering the operation of the phone. Calls are saved to the hard-drive of the computer and can be retrieved at any time for playback.

Call recording can benefit businesses and individuals in many ways, whether your business needs records of telephone orders or wants to record important conversations with customers the LG-Nortel USB module is a great addition to your telecoms infrastructure.
